

OCHRE & EMBER

IMPLEMENTATION PLAN & DESIGN SPECIFICATIONS

1. Goal Description

Build a premium, mobile-first menu website for Ochre & Ember. The site features a continuous storefront-to-menu transition scroll animation (rendered via HTML5 canvas for 60fps performance on mobile), a fully-interactive menu matching the final visual assets, search capabilities, category-specific filtering, a contact section, and automated compilation logs.

2. Key Design Decisions & Features

- **Storefront Scroll Sequence:** Preloads 120 frames (000.webp - 119.webp) and dynamically draws them on a canvas element matching user scroll depth.
- **Interactive Menu UI:** Replicates the visual layout of frame 119.webp in responsive HTML. Features a real search input and category filter pills.
- **Mobile-First Aesthetics:** Premium Cormorant Garamond and Inter fonts. Palette composed of light warm cream background, charcoal texts, and gold accenting.
- **Asset Preloading loader:** Shows a gold spinner and progress percentage of cached images before rendering the page, preventing frame stuttering.
- **Contact Section:** Contains physical location, phone contacts, and operating hours (9:00 AM to 10:00 PM).

3. Proposed Changes (Files List)

[MODIFY] `src/app/layout.tsx` : Imports Google Serif and Sans fonts, configures viewport and meta description.

[MODIFY] `src/app/globals.css` : Sets up CSS theme custom properties and utility scroll classes.

[NEW] `src/components/Preloader.tsx` : Asynchronously loads and caches sequence images, updates progress, and transitions out.

[NEW] `src/components/Hero.tsx` : Displays title text over `background_hero.jpeg` with a pulsing scroll indicator.

[NEW] `src/components/ScrollAnimation.tsx` : Sticky container mapping scroll position to canvas image rendering.

[NEW] `src/components/InteractiveMenu.tsx` : Provides the menu items with search and category pills matching frame 119.

[NEW] `src/components/ContactSection.tsx` : Renders phone number, operating hours, and location.

[MODIFY] `src/app/page.tsx` : Orchestrates loading state, scroll animations, menu view, and footer.

4. Verification Strategy

- Automated checks: Ensure production-level Next.js build compilation parses clean.
- Frame Preloader: Verify canvas sequence loads seamlessly without visual tearing.
- Interactive Matching: Verify the rendered HTML layout overlays the background style from 119.webp correctly and filters items by text search and category select.
- Logging verification: Confirm GEMINI.md tracks all steps accurately.
